PROJECT SHOWCASE

StockPilot AI

Smart Inventory Management

An inventory workflow designed to help small businesses track products, record sales, process purchase invoices and make more informed restocking decisions.

SALES & STOCK

RESTOCK INSIGHTS

Completed project • Demo walkthrough

Prepared from the supplied StockPilot AI brief and project demo recording

From manual stock tracking to a clearer workflow

The project targets common inventory problems in small retail businesses.

THE PROBLEM

Stockouts

Fast-moving products can run out before the owner notices.

Overstock

Slow-moving items tie up shelf space and working capital.

Manual entry

Purchase invoices and stock counts take time to maintain.

Limited visibility

Owners need one place to review stock, sales and reorder needs.

THE SOLUTION

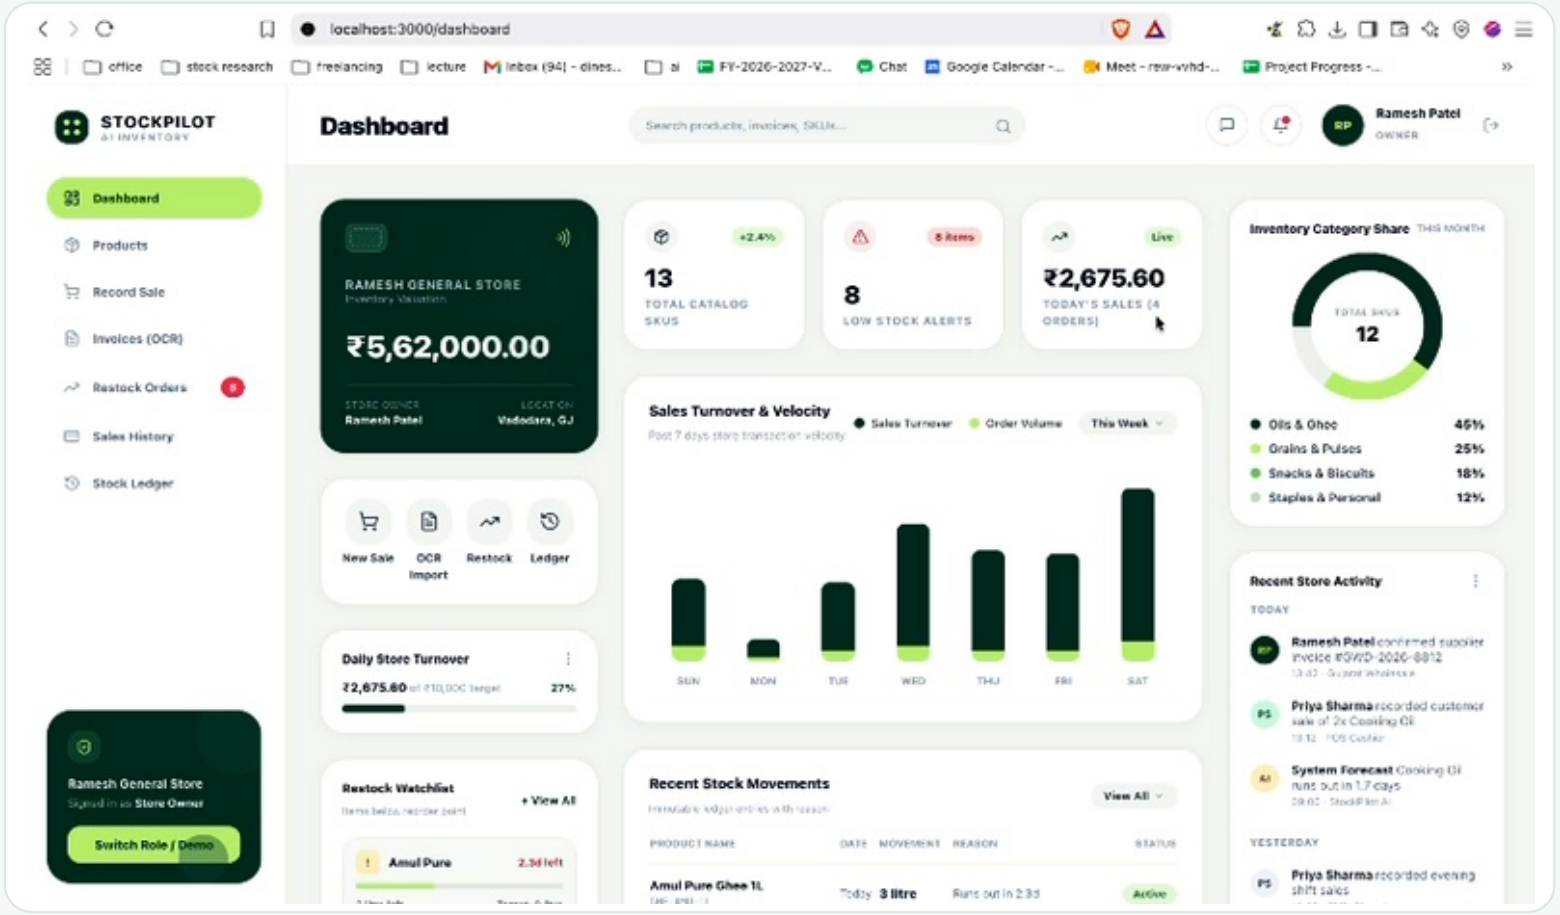

- **Central product catalog**
  Product details, prices, quantities and reorder levels.
- **Sales-led stock updates**
  Record sales and review sales receipts and stock movements.
- **Restock recommendations**
  Use sales velocity, stock on hand and lead time to guide decisions.
- **Operational visibility**
  Dashboard, catalog, sales and movement ledger in one interface.

Product direction

Make stock decisions easier to review, explain and act on — rather than relying on a notebook or disconnected records.

A dashboard for a fast stock overview

The demo opens with a consolidated view of inventory and business activity.

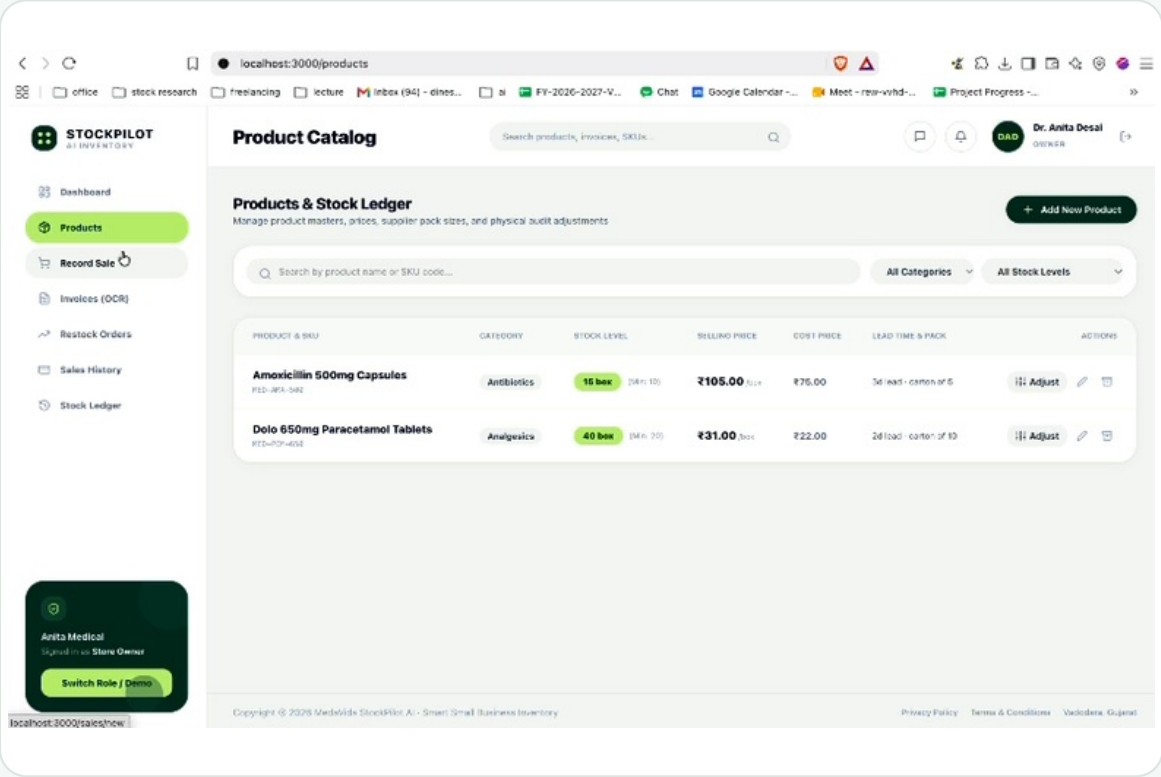

AT A GLANCE

- **Inventory summary**
  Headline cards surface key stock and sales indicators.
- **Visual trends**
  Charts make recent activity easier to scan.
- **Actionable alerts**
  Low-stock and restock information is presented alongside the overview.

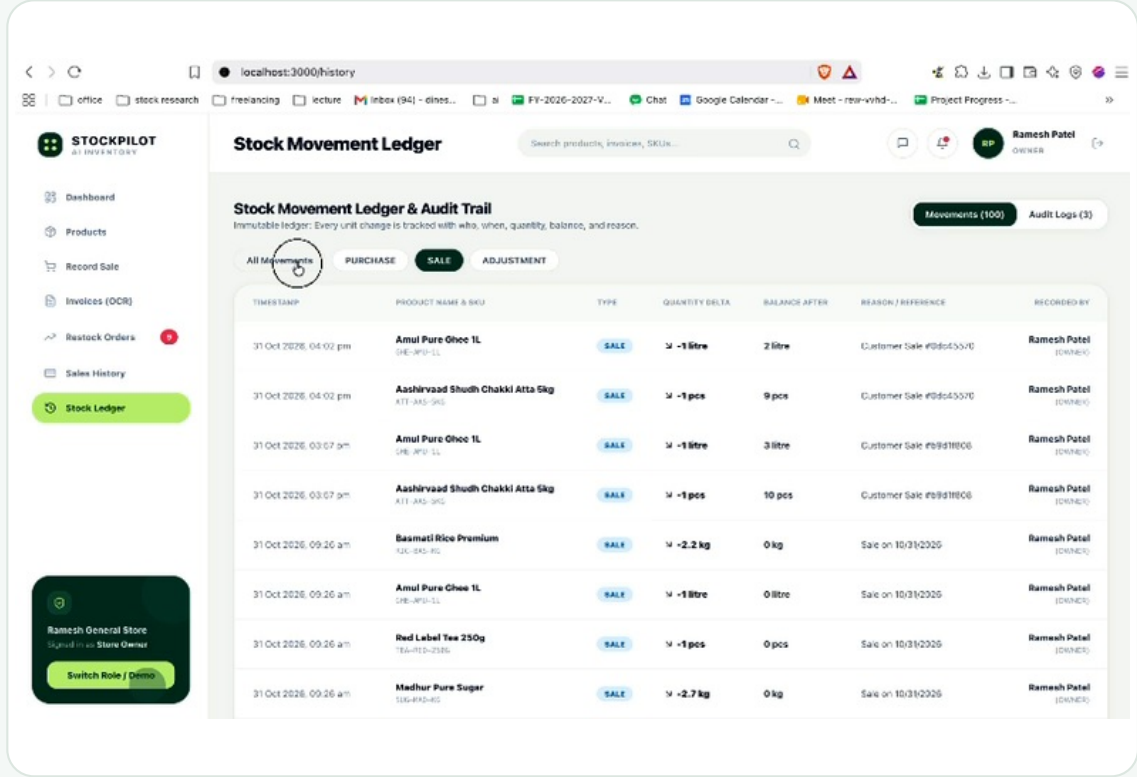

Shown: dashboard screen from demo video

Product catalog and stock movement history

Product management and a ledger-style view make inventory changes easier to trace.

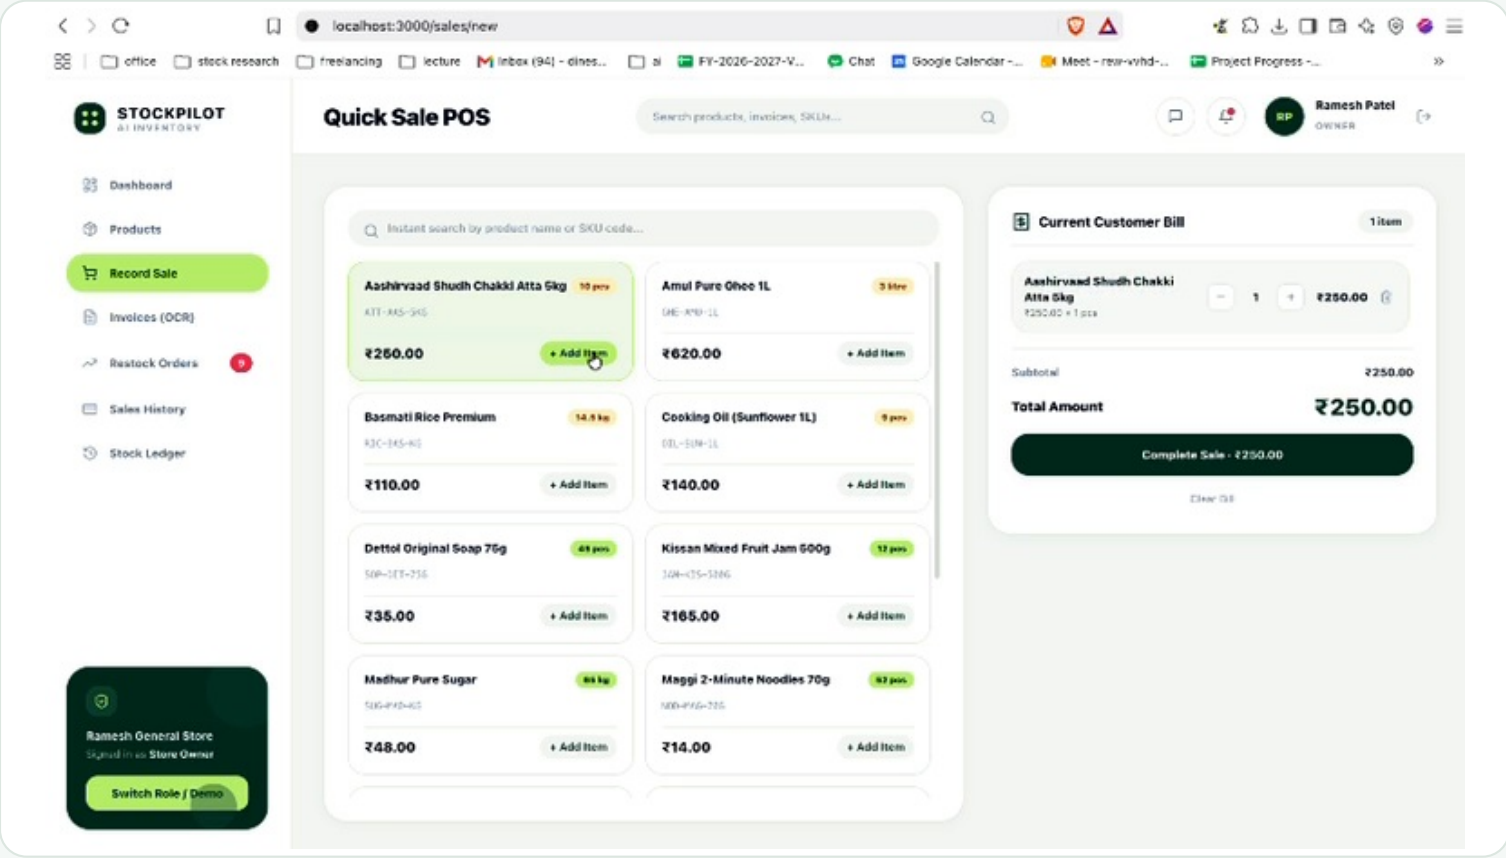

CATALOG Review product records and stock status.

MOVEMENT LEDGER See recorded inventory activity in one place.

Record sales and keep the workflow connected

The demo includes a quick-sale screen and a sales-receipts view.

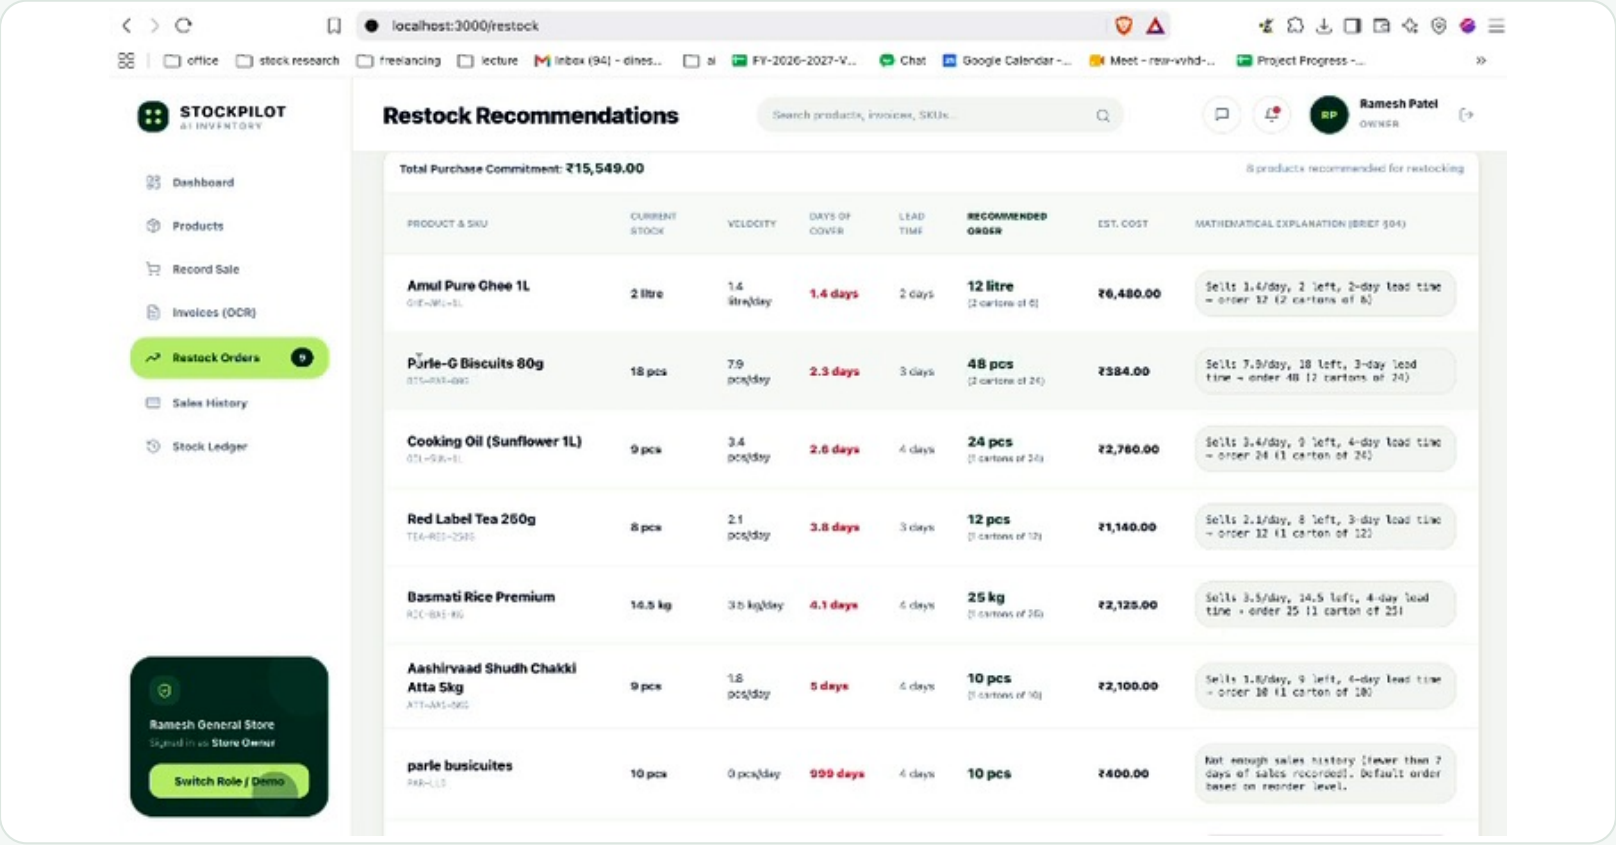

SALES FLOW

- **Select products**
  Build a sale from available catalog items.
- **Review the bill**
  Check quantities and the total before completing the sale.
- **Keep a receipt trail**
  The demo also shows a dedicated sales receipts screen.

Inventory rules should reject sales that exceed available stock and apply each confirmed sale once.

Turn sales history into a restock decision

Recommendations are most useful when the inputs and calculation are visible.

RECOMMENDATION LOGIC

1. Estimate average units sold per day from recent sales history.
2. Calculate days of cover from current stock and sales velocity.
3. Compare cover with supplier lead time to identify risk.
4. Recommend enough stock to cover lead time plus a target buffer.

Example in brief: 6 sold/day, 9 left, 4-day lead time → order 48.

Invoice import: extract, review, then confirm

The participant brief defines a human-reviewed OCR flow to protect stock accuracy.

01

UPLOAD

Accept invoice JPG, PNG or PDF.

02

EXTRACT

Read supplier, invoice metadata and line items with OCR.

03

REVIEW

Match products, edit uncertain fields and check totals.

04

CONFIRM

Apply purchase movements only after owner confirmation.

RELIABILITY PRINCIPLES

No negative stock

Reject sales beyond available quantity.

No duplicate imports

Warn if the same supplier invoice was imported.

Business isolation

Keep each business's inventory separate.

Auditability

Record who changed stock, when and why.

Note: OCR and reliability behaviours above follow the supplied project brief; the demo recording does not visibly show the full invoice-confirmation flow.

A practical foundation for small-business inventory

The project brings core inventory workflows into a single, demonstrable interface.

WHAT THE DEMO SHOWS

Dashboard

High-level inventory and activity view.

Product management

Catalog and add-product form.

Sales

Quick-sale interface and receipts list.

Stock visibility

Movement ledger and restock recommendations.

NEXT IMPROVEMENTS

Validate with real usage

Test with varied invoice layouts and realistic sales history.

Strengthen test coverage

Exercise concurrent sales, duplicate imports and role boundaries.

Improve explainability

Show forecast inputs, confidence/data sufficiency and reorder assumptions.

Production readiness

Add monitoring, backups, security review and deployment checks.

StockPilot AI

Smart inventory management — from product records to more informed replenishment.
